BeLive Tenant Support

A quick guide for your first run

For the local v0.3.0 prototype. Existing-tenant enquiries and complaints only.

Open the project on GitHub | Version 0.3.0

1. Open the app and sign in

1. Download this repository using **Code > Download ZIP** and extract it, or pull your existing copy. Install **Python 3.11+** if needed.
2. Double-click **Run BeLive Prototype.bat**. Open **http://127.0.0.1:8877** on the same computer. Keep the Python window open; press **Ctrl+C once** to stop it.
3. On an empty database, choose your own **username, display name and password** (12-128 characters). This creates the first **Admin**. There is **no default password**.

What is this account for? It is the operator account for this app. Admins manage records, connections, accounts and backups. They can create **Support** accounts under **Tenant & property records > Operator accounts** for staff handling cases. It is separate from Google/Facebook login, tenant access keys and AI credentials.

2. What each page does

Page	Main purpose
Overview	See open cases, urgency, overdue actions and cases needing staff attention.
Support cases	Create a complaint/enquiry, review AI assistance, assign staff handling, save replies, follow up and close with evidence.
Notifications	Review and approve messages for an external gateway. Delivery requires a configured gateway. Publishing to the local tenant portal is separate.
Public monitoring	Read selected authorised Google reviews, Facebook Page feed/post comments or Threads replies. Optional for a first demo.
Reviewed memory	Review wording from closed cases for future style guidance. Rejection/reopening stops reuse. This does not train a model or verify facts.
Tenant & property records	Add property guidance, verified tenants and support context. Issue portal keys, check the AI connection and manage operator accounts.
Database & records	Search saved records, correct support context, see/select the database and manage backups. A selection takes effect after restarting.
Reports & activity	See stored case counts and the activity history; export a support snapshot. Keep tenant exports private.

Where is everything saved? In the selected SQLite database, initially **data/belive.db**. Restarting or refreshing keeps saved records. Choosing a new file opens an empty workspace; the old records stay in the old file. Accounts also belong to that database.

Local prototype: GitHub shares the code, not a running website. Your friend runs their own copy and database. They cannot reach your computer using their own 127.0.0.1 address.

3. Try one case from start to finish

For practice, use clearly labelled **DEMO** records in a practice database. To make one: **Database & records > Choose database for next launch**, choose a new filename such as **demo.db**, restart and create its admin. For real cases, use authorised, verified company records.

1. **Add records:** In **Tenant & property records**, save property support guidance first, then a tenant linked to that property and unit. Label practice references/evidence as fictional DEMO data.
2. **Create a case:** Click **New support case**. Try title **Demo Wi-Fi enquiry**, describe the issue, select the demo tenant and choose **Internal / operator intake**, then **Create & assess**.
3. **Handle it:** If AI is not configured or cannot help, staff handover is expected. Open the case, choose **Acknowledge as staff**, add an action note and save the next action/deadline.
4. **Send a portal reply:** Edit **Response draft**, click **Save reviewed wording**, tick the evidence/review confirmation, then **Publish saved response to tenant portal**. Saving a draft alone does not send it.
5. **Try the tenant view:** As admin, use **Issue tenant portal access key**, select the tenant and issue a key. Open the tenant portal on the same computer and enter that key. The tenant can read, reply or select **Issue resolved / Still unresolved**. Tenant feedback does not close the case automatically.
6. **Finish with evidence:** In the operator case, add an action note and choose **Record action & start follow-up**. After checking the outcome, enter evidence, tick confirmation, choose **Record verified resolution**, then **Close verified case**. Complete open work orders first. Record only a simulated outcome for a DEMO case.

4. What do I put in Resource?

Resource identifies the company account, location or post to read. It is not a URL, tenant reference, property name or database location. Choose the matching API first.

Selected API / content	Example format only - replace with real IDs
Google Business Profile reviews	accounts/123/locations/456
Facebook Page feed	123456789/feed
Facebook post comments	123456789_987654321/comments
Threads post replies	123456789/replies

These numbers are **format examples**, not connected BeLive resources. Ask the authorised company account administrator for the actual IDs and API access. Company API tokens belong in this project's **.env**, not in Resource. Only confirm authorisation for an approved resource. See integration setup for the technical requirements.

No company IDs/tokens yet? Skip Public monitoring. Manual cases and the local portal are enough to demonstrate the workflow. Saving an authorised source starts checks every 15 minutes while the app runs; **Pause checks / Resume checks** control that source.

5. Three quick fixes

- **AI hands over to staff:** Configure the project's model/Hermes connection, restart and use **Test AI connection**. A real test may use provider credits. Staff handling works without AI.

- **Tenant sees no reply:** Save the reviewed draft, confirm it and publish it to the portal. Internal notes and unsent drafts stay private.

- **Records seem gone:** Check the active path in **Database & records** and reopen the original database. A new database is a separate workspace.
